

# What kind of system?

**“The idea of the average patient is a noninformative construct in psychiatry that falls apart when mapping abnormalities at the level of the individual patient”**

# What kind of system?

## 1. Non-*ergodic*

(non-stationarity of level & trend of central moments, non-homogeneous fluctuations/  
variance)

## 2. No *memorylessness* property

(after-effects of interactions with internal and external environment: long-range  
dependence, anomalous diffusion)
